Open to relocation — visa sponsorship required

Summary

Python backend developer with 1+ years of experience configuring and extending a low-code, EAV-based (Entity-Attribute-Value) SaaS platform for a US-based remote team. Skilled in Python, MySQL, PostgreSQL, RBAC/permissions design, BI dashboard and report building, Docker, and Linux server environments. Seeking a backend engineering role in the EU/UK with visa sponsorship.

Skills

Languages: Python (primary), SQL

Databases: MySQL, PostgreSQL

Data modeling: EAV (Entity-Attribute-Value) schema design, custom entity/attribute configuration

Access control: Role-based access control (RBAC), permission/segment configuration

Infrastructure: Docker, Linux (Ubuntu)

CI/CD & GitOps: ArgoCD, GoCD, Git/GitHub, Gitea

Observability: Grafana

Tools: Slack, internal ticketing systems, BI/dashboard & report building

Currently learning: AWS/GCP, Kubernetes basics, FastAPI

Experience

Python Developer — [Steepprock Inc.] (Remote)

[June - 2025] – Present

- Configure and extend a Python-based low-code platform built on an Entity-Attribute-Value (EAV) data model, defining custom entity types, attributes, and relationships to meet evolving business requirements for a client-facing SaaS product
- Implement role-based access control (RBAC) — defining user roles, permission segments, and field-level permissions across entity types
- Build BI dashboards and reporting tools (bar/pie/line charts, calendar views, report builders) by scripting against internal Python APIs, turning business questions into self-service reports for end users
- Work directly from a ticket-based requirements system, translating written specs into schema changes, permission updates, and UI configuration — [X tickets/week]
- Maintain and query production data across MySQL and PostgreSQL to support feature development, debugging, and reporting needs
- Push and manage code through Git-based workflows (GitHub, Gitea), including participation in CI/CD pipelines built on ArgoCD and GoCD
- Work within a Dockerized, Linux-based development and deployment environment; monitor service health using Grafana
- Collaborate with a distributed US-based team via Slack, working async across time zones

Projects

- **TicketFlow** — A ticketing API with EAV-style custom fields and role-based access control, built with FastAPI, PostgreSQL, Redis, and a MySQL reporting sync job. Includes Docker Compose setup, GitHub Actions CI, Kubernetes manifests, ArgoCD GitOps deployment, and Prometheus/Grafana monitoring. *[GitHub link]*

Education

BSc Computer Science — [University Name], United Kingdom

Graduated January 2022

Certifications

[Add once completed — e.g. AWS Certified Developer – Associate]
